

## ABSTRACT OF THE DISCLOSURE

A bearing device, a head support device, and a magnetic recording/reproducing device can be used in a HDD or the like for a long period of time and are able to meet the purposes such as size reduction, high performance, low noise, high speed, and low cost. The first retainer comprises a plurality of grooves at one end of a rotary axis of a retainer. The second retainer comprises a plurality of grooves at the other end of the retainer. It is configured in that grooves disposed in the first retainer and the second retainer are not positioned at the same outer periphery of the retainer so that each groove of the second retainer is circumferentially positioned between two grooves of the first retainer.
